

Differences between GOLD and BRONZE sites, set-B tiers, 95% gene-cluster intervals (1,000 resamples) unless marked. Dotted vertical line: primary P-all estimate; solid grey vertical line: no difference. Primary row, GOLD / BRONZE sites and gene clusters. No two-way interval is stored for P-human, so that marker is absent. Within-gene rows use the linear within-gene difference (S/T/Y records). The P-abund block (human proteins with an abundance value) shows the crude estimate and the adjusted designs with the stored protein-cluster intervals. A: conservation 93,308 / 37,591 sites, 17,777 gene clusters (P-human 49,939 / 17,477, 7,965) B: disorder 320,780 / 215,745 sites, 35,524 gene clusters (P-human 208,322 / 129,438, 17,144) C: sequence motif 324,907 / 478,837 sites, 37,901 gene clusters (P-human 211,848 / 324,000, 17,640)
